

Teaching Methodology

Vinicius Vieira | MET Preparation for Adult Learners and Healthcare Professionals

A diagnosis-first, feedback-based methodology designed to help adult learners prepare for the Michigan English Test with clarity, structure, and confidence.

Course focus balance

70% MET exam prep

30% communication

Diagnosis first

Personalized path

MET strategy

Practical feedback

Prepared as a professional overview for students, families, partner institutions, and course materials.

1. Core Principles and Approach

The methodology is built around a simple idea: students improve faster when they know exactly what to work on, why it matters for the test, and how to practice it in realistic tasks.

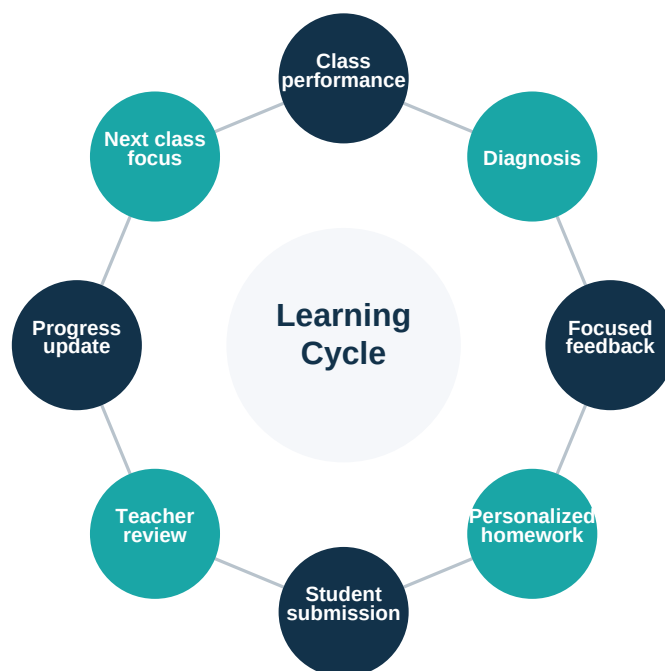

Diagnosis first Every student begins with a diagnostic process that identifies level, exam readiness, repeated errors, and the most urgent priorities.	Personalized learning Lessons and homework are selected according to real performance, target score, professional needs, and the student's deadline.
Exam strategy with real communication Students learn how to perform on the MET while building language that is useful for academic, professional, and healthcare contexts.	Clear feedback loop Feedback is specific, practical, and connected to the next step. Students are not overwhelmed with corrections; they receive a clear focus for improvement.
Purposeful repetition Key structures, vocabulary, and strategies are recycled across different tasks until students can use them under pressure.	Confidence through structure Students learn frameworks for speaking and writing so they can organize ideas quickly and communicate with more control.

Course positioning

The course combines MET preparation with professional communication practice. This is especially useful for nurses and healthcare professionals who need exam results for professional or immigration-related goals, but still want practical language they can use beyond the test.

2. The Learning Cycle

Each class is part of a continuous cycle. Evidence from class and homework is used to update the student's focus, so the course does not depend on random exercises or generic practice.

The cycle keeps the course structured: class performance creates diagnosis, diagnosis creates feedback, feedback creates personalized practice, and practice informs the next class.

3. Lesson Structure and Techniques

Lessons follow a predictable structure so students understand what they are doing and why. The class moves from awareness to guided practice, then to timed MET-style performance.

- 1 Opening**
Review the current focus, previous feedback, and today's target.
- 2 Model**
Show a strong example, answer frame, or strategy before production.
- 3 Guided practice**
Build language with support: structure, vocabulary, grammar, and pronunciation.
- 4 Timed MET task**
Move into exam-like practice under realistic time pressure.
- 5 Feedback**
Give clear, practical correction based on real performance.
- 6 Homework**
Assign focused practice connected to the diagnosis and next class.

Core speaking and writing framework

This framework helps students avoid short, disconnected answers. It is used in speaking opinions, persuasive answers, image description expansion, and writing development.

4. Main Teaching Techniques

The techniques below are used repeatedly across speaking, writing, reading, listening, grammar, and vocabulary lessons.

Model-based learning Students analyze strong examples before creating their own answers. This makes expectations clearer and reduces uncertainty.	Error pattern correction Repeated mistakes are identified as patterns, not isolated problems. This helps students understand the root of the issue.
Vocabulary recycling High-frequency MET vocabulary, healthcare language, collocations, connectors, and B2/B2+ expressions are reused across skills.	Timed practice Students practice under realistic MET timing to improve control, fluency, and task completion.
Inference training Reading and listening practice includes main idea, detail, and inference work, with special attention to meaning beyond the exact words.	Strategic homework Homework is assigned based on class evidence and is designed to be manageable for busy adult learners.

5. Assessment Methods

Assessment is continuous and evidence-based. The goal is to understand what the student can do now, what is improving, and what should be practiced next.

Method	What it checks	How it guides instruction
Diagnostic assessment	Current level, exam readiness, repeated patterns, and priority skills.	Defines the first learning path and the highest-impact priorities.
Class performance	Fluency, clarity, organization, accuracy, vocabulary, and task completion.	Allows immediate correction and sets the next class focus.
Speaking and writing review	Active production, idea development, grammar control, coherence, and timing.	Builds targeted practice for productive skills and MET tasks.
Homework evidence	Whether the student can apply strategies independently between classes.	Shows what should be reviewed, repeated, or upgraded.
Mock tests	Score readiness, timing, task management, and performance under pressure.	Tracks progress and identifies final exam priorities.

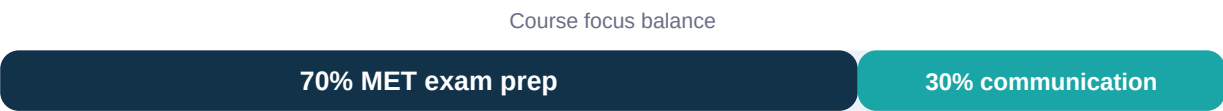

Student feedback style

Feedback is written in clear student-facing language. It highlights progress, identifies one main improvement focus, and gives practical next steps. More detailed diagnostic notes can remain teacher-only when necessary.

6. Student Engagement Strategies

Adult students are more engaged when practice feels relevant, realistic, and connected to their goal. The methodology uses clear goals, practical contexts, and manageable tasks to keep students moving forward.

Clear goals Each activity is connected to the student's MET target, current weakness, or professional need.	Professional contexts When appropriate, tasks include healthcare and workplace situations, such as patient communication, responsibilities, and decision-making.
Active participation Students speak, write, analyze examples, correct mistakes, and reflect on their performance.	Manageable homework Homework is focused and realistic for busy adults, emphasizing consistency rather than overload.
Supportive correction Mistakes are treated as useful evidence. Students receive correction in a respectful and motivating way.	Progress visibility Students can see what is improving and what remains the next priority, which helps build confidence.

7. Expected Outcomes

The methodology is designed to help students become more prepared, more independent, and more confident in exam and professional communication contexts.

Expected progression

Greater confidence under time pressure

Improved reading and listening inference

Better writing structure

Stronger speaking organization

Clearer exam strategy

- Better awareness of MET task expectations and timing.
- More organized speaking answers using clear structure and support.
- Clearer writing with stronger paragraph development and coherence.
- Improved grammar accuracy and more natural vocabulary use.
- Stronger reading and listening strategies, especially for inference.
- Greater confidence when performing under time pressure.

Methodology summary

This is a structured, diagnostic, personalized, and feedback-based approach. Students improve through a continuous process of diagnosis, practice, feedback, homework, review, and progress tracking.
